JAMA. 2016;315(8):801-810. doi:10.1001/jama.2016.0287

Sepsis is life-threatening organ dysfunction caused by a dysregulated host response to infection.

Septic shock is a subset of sepsis in which profound circulatory, cellular and metabolic abnormalities are associated with a greater risk of mortality than with sepsis alone.

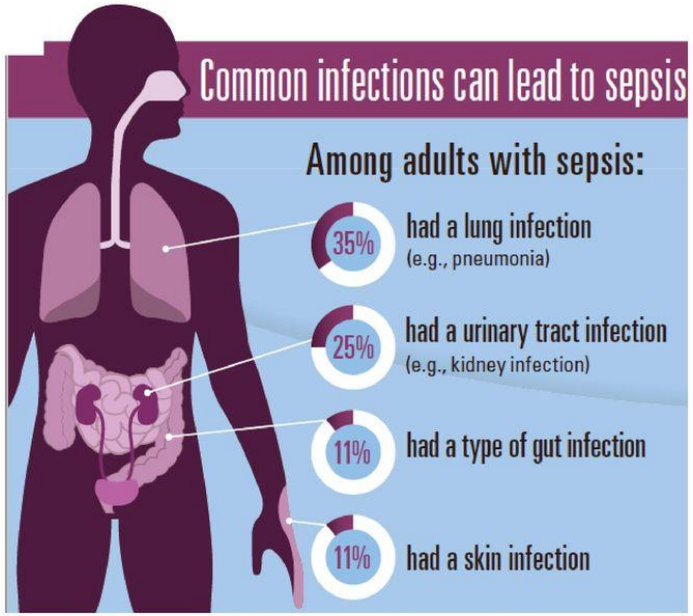

Table 1. Sequential [Sepsis-Related] Organ Failure Assessment Score[a]

System	Score 0	1	2	3	4
Respiration					
Pao_2/Fio_2, mm Hg (kPa)	≥400 (53.3)	<400 (53.3)	<300 (40)	<200 (26.7) with respiratory support	<100 (13.3) with respiratory support
Coagulation					
Platelets, $\times 10^3/\mu L$	≥150	<150	<100	<50	<20
Liver					
Bilirubin, mg/dL (μmol/L)	<1.2 (20)	1.2-1.9 (20-32)	2.0-5.9 (33-101)	6.0-11.9 (102-204)	>12.0 (204)
Cardiovascular	MAP ≥70 mm Hg	MAP <70 mm Hg	Dopamine <5 or dobutamine (any dose)[b]	Dopamine 5.1-15 or epinephrine ≤0.1 or norepinephrine ≤0.1[b]	Dopamine >15 or epinephrine >0.1 or norepinephrine >0.1[b]
Central nervous system					
Glasgow Coma Scale score[c]	15	13-14	10-12	6-9	<6
Renal					
Creatinine, mg/dL (μmol/L)	<1.2 (110)	1.2-1.9 (110-170)	2.0-3.4 (171-299)	3.5-4.9 (300-440)	>5.0 (440)
Urine output, mL/d				<500	<200

Abbreviations: Fio_2, fraction of inspired oxygen; MAP, mean arterial pressure; Pao_2, partial pressure of oxygen.

[a] Adapted from Vincent et al.[27]

[b] Catecholamine doses are given as μg/kg/min for at least 1 hour.

[c] Glasgow Coma Scale scores range from 3-15; higher score indicates better neurological function.

Sepsis-associated acute kidney injury: consensus report of the 28th Acute Disease Quality Initiative workgroup

nature reviews nephrology

Consensus statement 1a
We propose that sepsis-associated acute kidney injury (SA-AKI) be characterized by the presence of both consensus sepsis criteria (as defined by Sepsis-3 recommendations) and AKI criteria (as defined by Kidney Disease: Improving Global Outcomes recommendations) when AKI occurs within 7 days from diagnosis of sepsis (not graded).

Consensus statement 1b
We suggest that sepsis-induced AKI should be considered a subphenotype of SA-AKI in which sepsis is the predominant driver of tissue damage (not graded).

Consensus statement 1c
We suggest that AKI diagnosed within 48 h of the diagnosis of sepsis be defined as early SA-AKI, whereas AKI occurring between 48 h and 7 days of sepsis diagnosis be classified as late SA-AKI (not graded).

Consensus statement 1d
The epidemiology of SA-AKI varies and depends on the patient population and the criteria used to define AKI and sepsis (not graded).

Consensus statement 2a
Sepsis-associated acute kidney injury (SA-AKI) is a heterogeneous syndrome as multiple mechanisms contribute to injury with varying intensity between and within patients across the course of sepsis (not graded).

Consensus statement 2b
The relative contribution of one or more specific mechanisms that lead to injury defines distinct sepsis-induced AKI endotypes (not graded).

Consensus statement 2c
Modifiable and non-modifiable factors confer susceptibility to SA-AKI and determine the severity of AKI as well as the trajectory of recovery (not graded).

Consensus statement 2d
Integrating mechanism-specific biomarkers with clinical information will enable the identification of specific endotypes of SA-AKI (not graded).

Consensus statement 2e
Identifying distinct endotypes of SA-AKI might provide crucial prognostic information, help to define treatment responsiveness and enrich clinical trial populations (not graded).

Table 1. Pathways and Mediators of Sepsis, Potential Treatments, and Results of Randomized, Controlled Trials (RCTs).*

Pathway	Mediators	Treatment	Results of RCTs
	Superantigens: TSST-1	Anti-TSST-1	Not evaluated
	Streptococcal exotoxins (e.g., streptococcal pyrogenic exotoxin A)	Antistreptococcal exotoxins	Not evaluated
	Lipopolysaccharide (endotoxin)	Antilipopolysaccharide[9]	Negative
Innate immunity	TLR-2, TLR-4	TLR agonists[10] and antagonists	Not evaluated
	Monocytes, macrophages	GM-CSF, interferon gamma[11]	Not evaluated
	Neutrophils	G-CSF†	Not evaluated
Adaptive immunity	B cells (plasma cells and immunoglobulins)	IgG	Not evaluated
	CD4+ T cells (Th1, Th2)		
Proinflammatory pathway	TNF-α	Anti–TNF-α[13,14]	Negative
	Interleukin-1β	Interleukin-1–receptor antagonist[15]	Negative
	Interleukin-6	Interleukin-6 antagonist	Not evaluated
	Prostaglandins, leukotrienes	Ibuprofen,[16] high-dose corticosteroids[17]	Negative
	Bradykinin	Bradykinin antagonist[18]	Negative
	Platelet-activating factor	Platelet-activating factor acetyl hydrolase[19]	Negative
	Proteases (e.g., elastase)	Elastase inhibitor‡	Negative
	Oxidants	Antioxidants (e.g., *N*-acetylcysteine)[20]	Not evaluated
	Nitric oxide	Nitric oxide synthase inhibitor[21]	Negative

Table 1. (Continued.)

Pathway	Mediators	Treatment	Results of RCTs
Procoagulant pathway	Decreased protein C	Activated protein C[5]	Positive → Negative
	Decreased protein S	Protein S[22]	Not evaluated
	Decreased antithrombin III	Antithrombin III[23]	Negative
	Decreased tissue factor–pathway inhibitor	Tissue factor–pathway inhibitor[24]	Negative
	Increased tissue factor	Tissue factor antagonists	Not evaluated
	Increased plasminogen-activator inhibitor 1	Tissue plasminogen activator	Not evaluated
Antiinflammatory	Interleukin-10	Interleukin-10§	Not evaluated
	TNF-α receptors	TNF-α receptors[13]	Negative
Hypoxia	Hypoxia-inducing factor-1α, vascular endothelial growth factor	Early, goal-directed therapy[2] Supernormal oxygen delivery Erythropoietin[26]	Positive Negative Not evaluated
Immunosuppression or apoptosis	Lymphocyte apoptosis	Anticaspases[27]	Not evaluated
	Apoptosis of intestinal epithelial cells	Anticaspases[27]	Not evaluated
Endocrine	Adrenal insufficiency	Corticosteroids[28]	Mixed results¶
	Vasopressin deficiency	Vasopressin[29]	Not evaluated
	Hyperglycemia	Intensive insulin therapy[30,31]	Not evaluated‖

The application value of oXiris-endotoxin adsorption in sepsis

Yanping Zhai, Jiayu Pan, Chunyun Zhang

23 sepsis patients hospitalized from January 2018 to September 2019 in our ICU center and received oXiris-endotoxin adsorption were enrolled as the observation group, and another 30 sepsis patients hospitalized during the same period were selected as the control group treated with routine continuous renal replacement therapy (CRRT). The study acquired the approval by hospital ethics committee.

Table 1. Comparison of clinical data between two groups of patients

Group	Number of Cases	Gender		Age (years old, $\bar{x}$±sd)	APACHE II score (points, $\bar{x}$±sd)	MAP (mmHg, $\bar{x}$±sd)	Urine volume (ml, $\bar{x}$±s)
		Male	Female				
Observation group	23	13	10	59.73±13.02	21.46±2.55	74.81±13.40	416.92±78.69

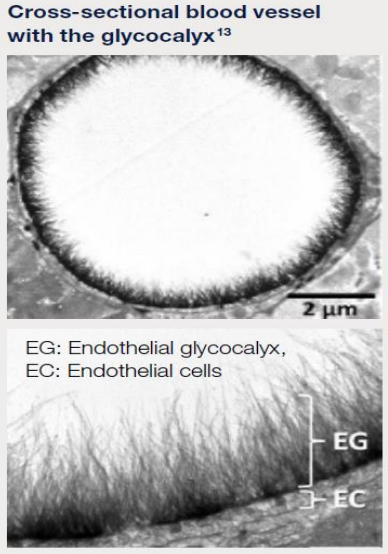
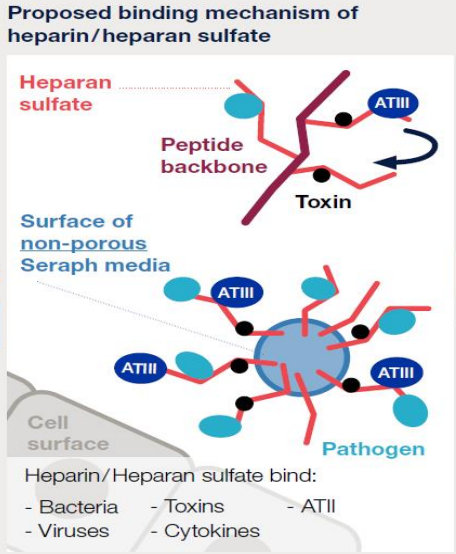
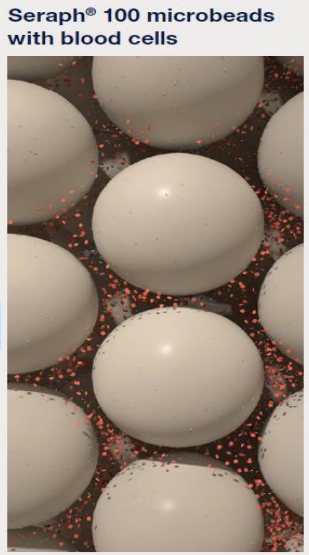
Characteristics of extracorporeal blood purification therapies available for sepsis and SA-AKI

Technology	Indication	Modality	Target of removal	Mass separation mechanism	Comments
PAES-PVP high-flux	KRT, hyperinflammation	HD, HFL, HDF	Fluids, electrolytes, middle molecules	Convection, diffusion	CRRT for kidney support
AN69-PEI-heparin	KRT, hyperinflammation, Gram-negative sepsis or endotoxaemia	HD, HF, HDF	Fluids, electrolytes, middle molecules, endotoxin	Adsorption, convection, diffusion	CRRT for kidney and immunomodulatory support
AN69-ST, PMMA	KRT, hyperinflammation	HD, HF, HDF	Fluids, electrolytes, middle molecules	Adsorption, convection, diffusion	CRRT for kidney and immunomodulatory support
PAES-PVP MCO and HCO	KRT, hyperinflammation	HD	Fluids, electrolytes, middle molecules	Diffusion	CRRT for kidney and immunomodulatory support
Plasmasulfone, polypropylene (for membrane plasmapheresis)	Hyperinflammation	Centrifugation or HF	Fluids, electrolytes, middle molecules, endotoxin	Convection (membrane); gravity sedimentation (centrifuge)	Immunomodulatory support
Heparin covalently bound to polyethylene	Viraemia, bacteraemia, fungaemia	Haemoadsorption	Bacteria, fungi, viruses	Adsorption	Selective immunomodulatory support
Porous polymer beads polystyrene divinylbenzene	Hyperinflammation	Haemopadsorption	Protein-bound compounds, middle molecules	Adsorption	Non-selective immunomodulatory support
PMX covalently bound to polypropylene–polystyrene fibre	Gram-negative sepsis or endotoxaemia	Haemoadsorption	Endotoxin	Adsorption	Selective immunomodulatory support







The endothelial glycocalyx

- Key constituents: glycoproteins, proteoglycans and glycosaminoglycans
- Multiple functions, including the regulation of vascular permeability[13]
- Many viruses and bacteria can bind to cell surface heparan sulfate proteoglycans, facilitating initial pathogen attachment and promoting infection[14]

A surrogate glycocalyx

The microbead broad-spectrum adsorption media of Seraph® 100 use chemically bonded heparin to mimic the natural endothelial cell surface.

The surrogate glycocalyx can be expected to bind certain pathogens circulating in the bloodstream.[4]

Polymyxin B hemoperfusion therapy	34	34	32	30	27	22	18
Conventional therapy	30	22	19	15	15	12	11

Patients in the polymyxin B hemoperfusion group were treated with 2 sessions of direct hemoperfusion with polymyxin B in addition to standard conventional therapy.

Polymyxin B hemoperfusion added to conventional therapy significantly improved hemodynamics and organ dysfunction and reduced 28-day mortality in a targeted population with severe sepsis and/or septic shock from intra-abdominal gram-negative infections.

ORIGINAL

Polymyxin B hemoperfusion in endotoxemic septic shock patients without extreme endotoxemia: a post hoc analysis of the EUPHRATES trial

D. J. Klein[1*], D. Foster[2], P. M. Walker[2], S. M. Bagshaw[3], H. Mekonnen[4] and M. Antonelli[5]

Intensive Care Med (2018) 44:2205–2212

Methods: Post-hoc analysis of the EUPHRATES trial for the 194 patients with EAA ≥ 0.6–0.89 who completed two treatments (PMX or sham). The primary end point was mortality at 28 days adjusted for APACHE II score and baseline mean arterial pressure (MAP). Additional end points included changes in MAP, cumulative vasopressor index (CVI), median EAA reduction, ventilator-free days (VFD), dialysis-free days (DFD) and hospital length of stay. Subpopulations analyzed were site and type of infection and those with norepinephrine dose > 0.1 mcg/kg/min at baseline.

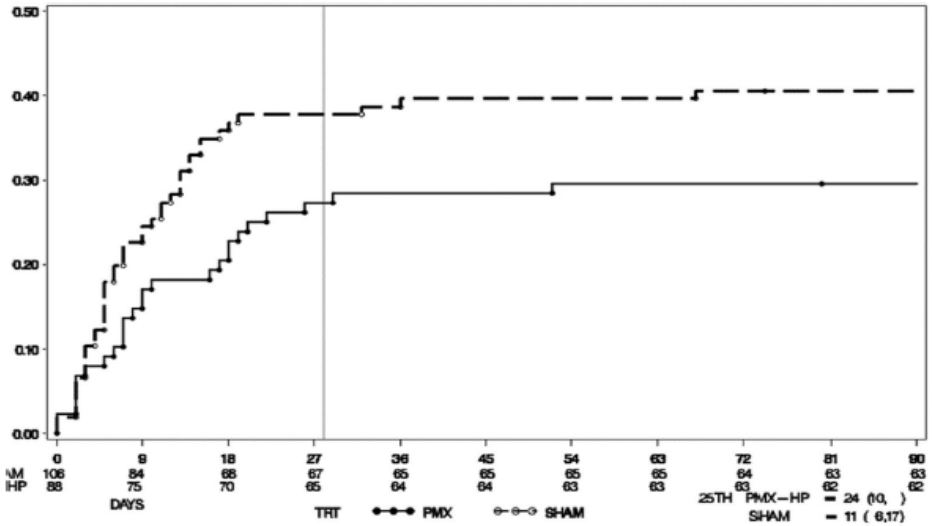

Fig. 2 Time to death within 90 days for PMX versus sham. Kaplan-Meier estimates of the probability of survival to day 90 among 194 per-protocol patients with MODS > 9 and EAA between 0.6 and 0.89, by treatment groups. The 90-day results of Cox proportional hazards adjusted for baseline MAP and APACHE II score are the hazard ratio [0.57, 95% CI (0.35, 0.93), *P* value = 0.02]. The vertical line represents the 28-day interval. The 28-day adjusted Cox proportional hazard ratio for death in the PMX group compared with the sham group is 0.58 (95% CI, 0.35 to 0.98; *P* = 0.04). *TRT* treatment, *25th* 25th percentile at 90 days

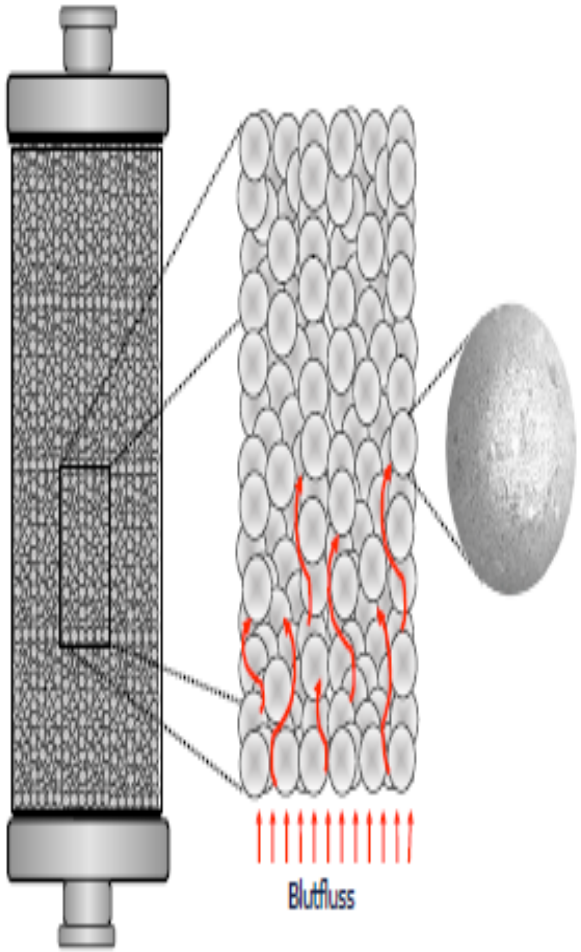
Treatment with PMX was associated with a significant change in median MAP (8 vs 4, p<0.05) and median (IQR) ventilator-free days to 28 days (20 vs 6, p=0.004).

The wind changed direction and the big river still flows: from EUPHRATES to TIGRIS

Toshiaki Iba[1*] and David J. Klein[2] *Journal of Intensive Care* (2019) 7:31

The study will be repeated…Using a precision medicine approach, eligibility have been modified in TIGRIS to include patients with MODS score > 9 and EAA levels between 0.60 and 0.89.

Polymer-Technology



- 300ml filter with a „bead"-design
- Hightech-polymer
- Size selection < 55kD
- Low flow resistance
- 120ml bloodvolume / filling volume
- Pre-filled with sodium-chlorid
- Gamma-steril, 3 year storage

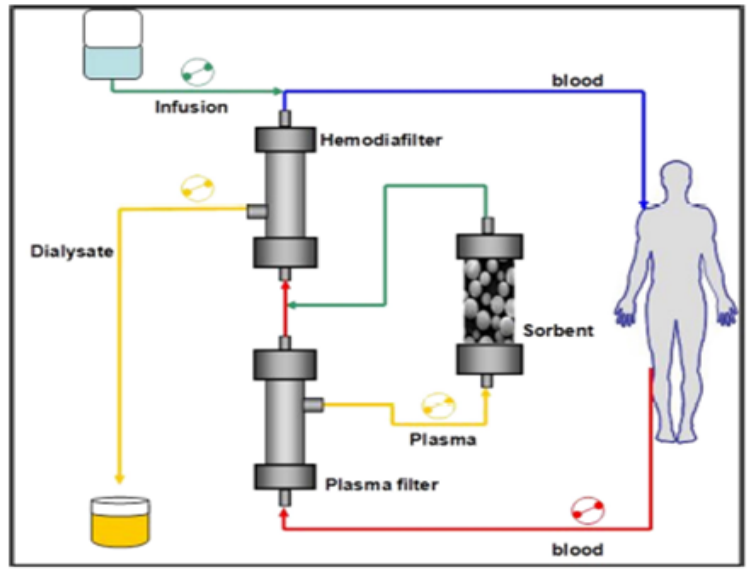
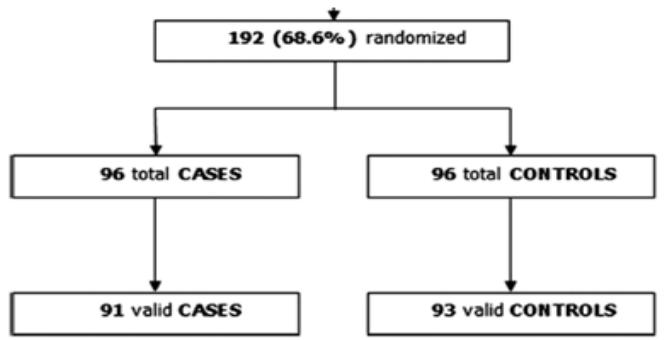
Efficacy of coupled plasma filtration adsorption (CPFA) in patients with septic shock: A multicenter randomised controlled clinical trial

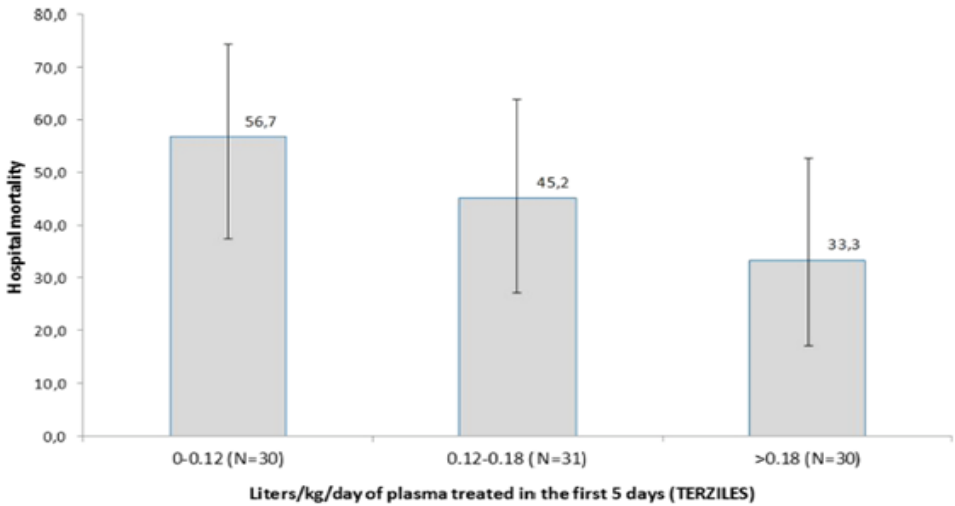
BMJ Open

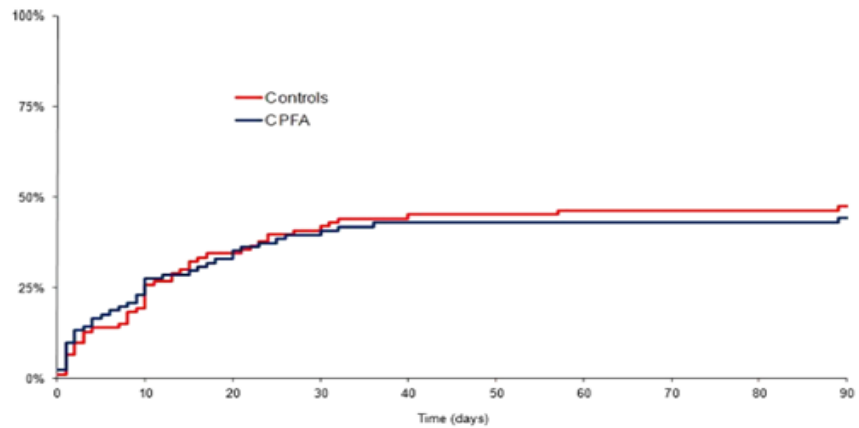
BMJ Open 2014;**4**:e003536.

Sergio Livigni,[1] Guido Bertolini,[2] Carlotta Rossi,[2] Fiorenza Ferrari,[1] Michele Giardino,[2] Marco Pozzato,[3] Giuseppe Remuzzi,[2] GiViTI: Gruppo Italiano per la Valutazione degli Interventi in Terapia Intensiva (Italian Group for the Evaluation of Interventions in Intensive Care Medicine) is an independent collaboration network of Italian Intensive Care units









CPFA did not reduce mortality in patients with septic shock, nor did it positively affect other important clinical outcomes. A subgroup analysis suggested that CPFA could reduce mortality, when a high volume of plasma is treated.

Extracorporeal and novel therapies for SA-AKI

Consensus statement 5a

Extracorporeal blood purification (EBP) techniques can be used to remove pathogens, microbial toxins, inflammatory mediators and toxic metabolites from the blood as well as replenish solutes (grade 1A).

Consensus statement 5b

Kidney replacement therapy provides organ support through solute control, blood detoxification, and fluid balance via diffusion, convection and adsorption. Peritoneal dialysis can be used for kidney support when extracorporeal techniques are unavailable (grade 1A).

Consensus statement 5c

Emergent indications for initiating kidney replacement therapy do not differ between SA-AKI and other types of acute kidney injury (grade 1A).

Consensus statement 5d

Initiation of EBP in sepsis might be considered for immunomodulatory support in patients who meet explicit and timely clinical and/or biological criteria, such as high concentrations of damage-associated molecular patterns and pathogen-associated molecular patterns, as well as other targets of systemic inflammation (not graded).

Consensus statement 5e

Optimal delivery of extracorporeal therapies is determined by factors such as timely and safe initiation, treatment duration, appropriate vascular access placement and maintenance, individualized patient dose, safe and effective anticoagulation protocols, appropriate adjustments of medications (for example, antimicrobials or vasopressors) and nutrients, and a dynamic prescription of fluid removal (not graded).

Consensus statement 5f

Safe and effective therapy requires objective indicators of treatment response, which must be evaluated throughout the therapy course with a focus on patient-centred care goals (grade 1B).

Sepsis-associated acute kidney injury: consensus report of the 28th Acute Disease Quality Initiative workgroup

Research questions

1. How do the EBP therapies affect the pathophysiology of SA-AKI?
2. In which subgroup of patients, and when in the clinical course of the disease, might EBP therapies be beneficial?
3. Are EBP therapies safe, efficacious and cost-effective?
4. What meaningful target molecules can guide EBP therapy, and can their kinetics be employed to assess response to treatment?
5. What is the effect of EBP therapies on other organ systems during sepsis?

Platform trial: A type of randomized clinical trial design in which multiple interventions can be evaluated simultaneously against a common control group with flexibilities of allowing new interventions to be added and the control group to be updated throughout the trial
